◆ ◆ ◆

First, I thank God for the health and patience that carried me through this work.

I am deeply grateful to my supervisor, Professor Paolo Rinaldi, for a year of weekly meetings, for reading three drafts of every chapter, and for letting me rebuild the actuator twice when it would have been easier to accept the first version. I also thank my co-supervisor, Dr Elisa Conti, who taught me how to run tests with patients safely and ethically.

This thesis would not exist without the physiotherapists at the rehabilitation centre, and especially Marta, who tested every version of the glove and told me honestly when it was uncomfortable. I thank the nine patients who volunteered their time for the trials. My lab mates, Luca and Ahmed, shared the 3D printer with me at all hours and never complained.

My studies were supported by a scholarship from Opera Universitaria, which made it possible for me to study in Trento.

Finally, my parents in Fès called me every Sunday and never once asked when I would finish. My sister Salma sent me a message before every exam, and my friend Nadia read chapter 4 when I could no longer see its mistakes. This thesis is theirs as much as mine.
